

# IndiaAI CyberGuard AI Hackathon

## CybeRaptor Hackathon Report

### 1. Introduction

- **Project Overview:**  
CybeRaptor aims to develop an AI based classifier for cybercrime reports, enabling categorization of unstructured text into predefined `categories` and `subcategories`. This solution aids law enforcement and regulatory agencies in classifying incidents more efficiently, aligning with Government of India regulations.
- **Project Objective:**  
The objective is to accurately classify each crime related text entry into categories such as `Cyber Bullying`, `Fraud`, `Online Financial Fraud`, and more, providing a rapid and reliable solution for law enforcement prioritization.

### 2. Dataset Description

- **Data Sources:**  
Two datasets, `train.csv` and `test.csv`, were provided. Each entry is labeled with a primary `category`, specific `sub\_category`, and `crimeadditionalinfo`, the latter being the text body we aim to classify.

- **Data Structure:**

Columns:

*`category`, `sub\_category`, `crimeadditionalinfo`, `category\_encoded`,  
`sub\_category\_encoded`, and `cleaned\_crimeinfo`.*

Dataset Counts:

Train Data: 87,095 records

Test Data: 28,993 records

Unique Categories: 17 in total

### 3. Data Preprocessing and Cleaning

- **Cleaning Steps:**

Text Cleaning: Stripped whitespace, removed special characters, and converted text to lowercase in the `crimeadditionalinfo` field.

Handling Nulls: Filled any missing values in `crimeadditionalinfo` to ensure compatibility with our vectorization process.

Encoded Labels: Applied Label Encoding to `category` and `sub\_category` columns, allowing the model to process these as numeric targets.

- **Feature Engineering:**

Vectorization: Transformed `cleaned\_crimeinfo` into numerical data using TFIDF Vectorization (with `max\_features=2000`). This captures the significance of words in a compact representation.

Label Encoding: Encoded categories and subcategories into numerical labels for classification.

### 4. Exploratory Data Analysis (EDA):

- **Category and Subcategory Distribution:**

Visualizations of `category` distributions in `train.csv` revealed imbalances, with some classes being underrepresented. For instance, `Online Financial Fraud` had significantly more samples than smaller categories like `Hacking`.

- **Term Frequencies:**

Using TFIDF, we extracted common terms across each category, observing overlaps that informed model tuning, especially where categories had similar vocabularies.

## 5. Model Selection and Training

- **Vectorization Process:**  
We vectorized `cleaned\_crimeinfo` using TFIDF, limiting to 2000 features to enhance model efficiency.
- **Baseline Models:**  
We tested initial models with Naive Bayes and Random Forest classifiers. Naive Bayes was found to be suitable due to its straightforward handling of text data.

### Final Model:

- **Model Choice:** Multinomial Naive Bayes, optimized with a `TFIDF` feature limit of 2000 for efficient text vectorization.
- **Hyperparameter Tuning:** Tuning `alpha` and other parameters yielded improved accuracy, particularly for underrepresented categories.
- **Balanced vs. Imbalanced Classes:** Tests on the imbalanced data showed that working with original data distributions improved accuracy.

## 6. Evaluation Metrics

- Metrics Used:
  - Accuracy: Overall prediction correctness.
  - Precision and Recall: Calculated for each class to evaluate model performance on specific classes.
  - F1Score: Balanced metric accounting for both precision and recall.
- 
- Results:
  - Accuracy: 73.7%
  - Precision, Recall, and F1Score: Achieved varying performance per category. Below is the classification report:

Accuracy: 0.7368533409236462

### Classification Report:

	precision	recall	f1score	support
0	0.34	0.29	0.31	3155
1	0.95	0.19	0.32	103
2	0.73	0.06	0.12	128
3	1.00	1.00	1.00	1128
4	0.00	0.00	0.00	59
5	0.33	0.18	0.23	511
6	0.00	0.00	0.00	53
7	0.84	0.89	0.87	17276
8	0.00	0.00	0.00	155
9	0.49	0.64	0.56	3634
10	0.00	0.00	0.00	17
11	1.00	0.91	0.95	835
12	0.00	0.00	0.00	1
macro avg	0.45	0.28	0.29	28106
weighted avg	0.72	0.74	0.71	28106

## 7. Error Analysis and Model Improvement

### Error Insights:

- Classes with limited samples (e.g., 'Hacking') demonstrated lower recall.
- Categories with similar vocabularies showed moderate confusion, highlighting the model's limitations with closely related classes.

### Improvement Strategies:

- Advanced Embeddings: Future iterations could incorporate BERT embeddings for context capture.
- Data Balancing: Additional sampling techniques could address class imbalances.

## 9. Report Summary

- **Project Outcome:**  
The model achieved a balanced performance across various categories, reaching an accuracy of 73.7% on test data.
- **Future Enhancements:**  
Advanced NLP models and sampling techniques could further refine performance.  
Potential for a realtime deployment for law enforcement usage.

## 10. Appendices

- **Code:** Provide snippets from key stages, including data preprocessing, model training, evaluation, and user interaction.
- **Execution Environment:** Documented usage of Python libraries (e.g., pandas, sklearn) and Colab for cloudbased processing.

## Visuals and Screenshots:

Screenshots from Colab for:

Evaluation metrics and classification reports

The screenshot shows a Jupyter Notebook interface with a dark theme. The top bar includes the CybeRaptor logo, the filename 'CybeRaptor.ipynb', and a star icon. Below the top bar is a menu bar with 'File', 'Edit', 'View', 'Insert', 'Runtime', 'Tools', and 'Help'. The main area displays a classification report for 15 classes (0-14). The report includes precision, recall, f1-score, and support for each class, as well as overall accuracy, macro avg, and weighted avg. Below the report, there are three identical warning messages from sklearn's metrics module, indicating that precision is ill-defined and being replaced with the mean for classes with zero support. The bottom status bar shows '13s completed at 11:27 PM'.
